

Cisco Umbrella and Cisco Meraki

Simple and effective protection for your network.

What if you could protect every user on your Cisco Meraki network effortlessly? That's the power of integrating Cisco Meraki and Cisco Umbrella. You can instantly secure every user, app, and device on and off your Meraki network, with no added latency or additional appliances required.

Easiest solution to deploy and manage

This integration brings together two cloud-managed solutions to simplify deployments and provide effective and immediate protection for users. Umbrella deploys in minutes across your network to deliver the best protection against threats like malware, ransomware, and C2 callbacks.

Meraki MR and Umbrella – Secure and manage Wi-Fi from a single dashboard

For additional control and convenience at the wireless layer, you can choose to apply Umbrella policies directly in the Meraki dashboard. This makes it easier to manage your global wireless infrastructure and report on user traffic. Plus, you'll simplify the onboarding and policy configuration process with the convenience of centralized cloud management.

Meraki MX and Umbrella – Broadest network protection against threats

The Umbrella and Meraki MX integration provides expanded visibility for broader protection against threats on and off-network. Because Umbrella stops threats earlier, security teams have fewer alerts to investigate – saving you time and money. By combining IPS and AMP events from Meraki MX with Umbrella's DNS-layer security, you can quickly identify exposure and prioritize remediation efforts in real-time, separating security events from non-security events. Together, Umbrella and Meraki deliver the most comprehensive coverage across your entire deployment – whether that's for your Software Defined WAN, wired and wireless networks, or roaming devices.

Reliable network coverage and security protection, fast.

It's the fastest and easiest way to secure your Meraki network against internet threats.

Combine with 100% business uptime from Umbrella, for reliable protection you can count on.

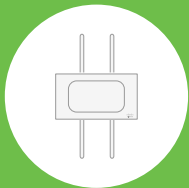

4 ways to simplify your network security:

- 1** Combine network and security data for insights that not only help you optimize your network's performance, but also secure it.
- 2** Deploy easily to thousands of devices and deliver instant protection across your entire network.
- 3** Manage centrally for better visibility and control of devices. You can either use pre-set policies for out of the box integration, or use an API key to link accounts, create policies in Umbrella, and easily assign them in the Meraki dashboard with SSID or Group policies.
- 4** As part of your SD-WAN strategy, secure your direct internet access across distributed locations without having to backhaul traffic to apply policies. You'll get broad protection against threats for roaming users, branch locations, and more.

Take a test drive

To try Meraki: View an instant demo, request free-trial gear, or get a free trial access point, just by attending a webinar. [Visit this page to get started.](#)

To try Umbrella: visit [signup.umbrella.com](#) and request a free 14 day trial.

Meraki MR

The world's first enterprise-grade line of 100% cloud-managed wireless access points.

- Manage your IT infrastructure from a centralized dashboard
- Provides visibility into application, device, and usage statistics
- No controller hardware to install or maintain

Meraki MX

An enterprise security & SD-WAN appliance 100% cloud-managed for distributed deployments.

- Provide visibility into networked clients, bandwidth consumption and usage stats
- Built-in IPS, Malware Protection, and URL Content Filtering
- Simplest VPN and SD-WAN solution on the market

Cisco Umbrella

A secure internet gateway that provides the first line of defense against threats on the internet.

- Protection against threats like malware, ransomware, & C2 callbacks with no added latency
- Visibility into internet activity across all locations and users.
- No hardware to install or software to manually update.
