

# Supply Chain Planning: Comparing Legacy Tools with a Connected Model

Supply chain planning has become a messy affair, marked by day-to-day uncertainty, siloed teams and partners, and a near-constant host of potential interruptions. So how are planners supposed to make predictions in an unpredictable environment? The answer is e2open Connected Planning.

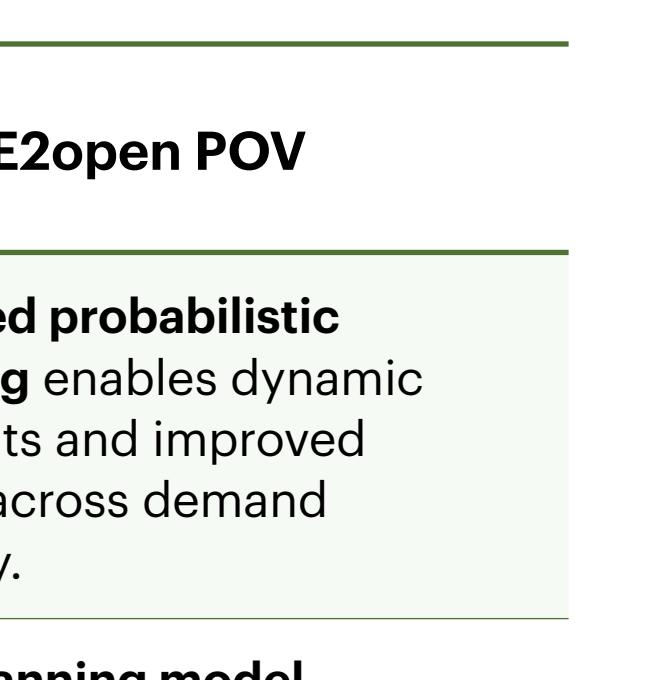

In this infographic, you'll learn how a modernized approach to planning can drastically improve the way your supply chain responds to adversity.

## Current trends and challenges shaping the future of planning

In the table below, you'll find the most common challenges facing modern supply chain planners and the responses required to stay ahead of disruption.

INCREASING RISKS	RISING COSTS
<ol style="list-style-type: none"><li>Predict ever-shifting demand patterns</li><li>Understand variable supply capacity and availability</li><li>Track fluctuating logistics lead times</li><li>Follow ever-changing, complex trade regulations</li><li>Respect ESG and SCOPe 3 regulations</li></ol>	<ol style="list-style-type: none"><li>Lower inventory stocking levels without impacting service</li><li>Reduce expediting costs</li><li>Improve planner productivity through automation</li><li>Reduce total cost to service demand across the value chain</li></ol>
LACK OF AGILITY	EVOLVING TECHNOLOGY
<ol style="list-style-type: none"><li>Drive better decisions across the entire supply chain</li><li>Balance competing corporate objectives and KPIs</li><li>Proactively respond to shifting demand patterns</li><li>Evaluate solution options to mitigate the impact of disruptions</li></ol>	<ol style="list-style-type: none"><li>Speed the cycle time to gather, cleanse, and synthesize data</li><li>Streamline processes for collaboration and consensus</li><li>Consolidate the number of systems needed for planning</li><li>Adopt AI and modern technologies to retain competitive advantage</li></ol>

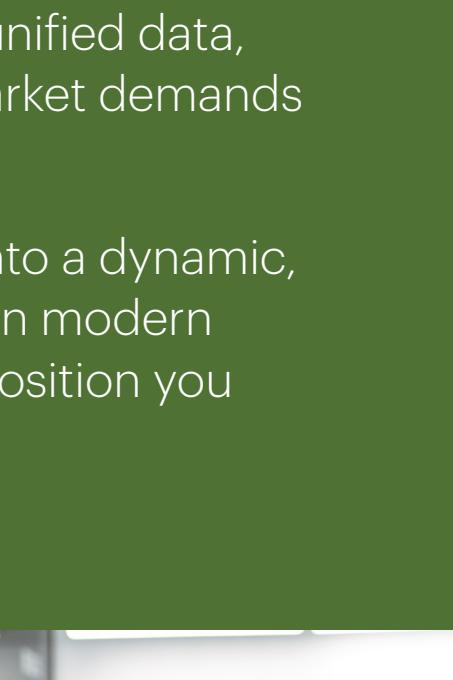

## Side-by-side comparison: Traditional supply chain planning vs. e2open Connected Planning

Traditional planning tools are siloed from both execution and external events, leaving them in the dark. However, e2open Connected Planning is a modernized approach that inherently closes the loop, providing bidirectional communication for enhanced visibility, collaboration, and continuous feedback for improvement. It is AI-enabled at every step to support informed decision-making, process orchestration, and automated replanning.

### A comparison between traditional planning tools and a connected model.

Traditional Point-Solution Tools	e2open Connected Planning
<b>SILOED</b> Fragmented systems requiring manual data exchange; siloed processes across demand, supply, and inventory planning.	<b>INTEGRATED</b> Unified platform with an Integrated Data Model connecting demand, supply, inventory, and channel planning in real time.
<b>MYOPIC</b> Limited to internal enterprise data; lacks multi-tier partner insights.	<b>HOLOSTIC</b> End-to-end visibility across multiple tiers and partners, enabling proactive risk management and collaboration.
<b>SLUGGISH</b> Slow response to disruptions; dependent on periodic S&OP/IBP cycles.	<b>AGILE</b> Dynamic scenario planning and real-time adjustments powered by AI and digital assistants for continuous planning.
<b>MANUAL</b> Often rule-based with minimal AI; or the AI is treated as an overlay. Limited automation and predictive capabilities.	<b>AUTOMATED</b> Embedded AI, machine learning, and autonomous planning for predictive and prescriptive decision-making for continuous planning.
<b>CLUNKY</b> Complex, rigid interfaces and a high dependency on IT for configuration.	<b>SLEEK</b> Modern, intuitive UX with connected dashboards and digital assistants for ease of use and faster adoption.
<b>LIMITED</b> Difficult to scale across global networks; integration challenges with diverse data sources.	<b>SCALABLE</b> Highly scalable architecture that supports large models, multi-source data, and global collaboration.

## The e2open point-of-view: How companies can embrace the evolution of planning

As supply chain planning continues to advance in today's rapidly evolving landscape, high-performing organizations embrace new approaches and technologies to effectively manage ongoing change. This section highlights the critical factors shaping future success and offers the e2open perspective on strengthening resilience and agility within modern planning processes.

### Observation

Companies are moving away from rigid, forecast-driven models based solely on historical data.

Traditional cyclic processes reduce agility in volatile markets.

Most disruptions originate outside the enterprise, so organizations seek integrated views across tiers and partners.

Proactive risk management and rapid adaptation are essential.

AI adoption is critical at the point of decision to improve speed, agility, and resilience.

### e2open POV

**AI-powered probabilistic forecasting** enables dynamic adjustments and improved accuracy across demand and supply.

**Unified planning model** with real-time visibility and scenario planning accelerates decision-making.

**Multi-enterprise collaboration** and a single data model connect data, people, and decisions across ecosystems.

**Dynamic scenario management** and contingency planning help businesses respond confidently to disruptions.

**Embedded AI and autonomous planning** deliver actionable insights without bolt-on complexity.
