ON: Carve baffles, spaced 12 in. on center

### TEST METHOD

Riverbank Acoustical Laboratories™ is accredited by the U.S. Department of Commerce, National Institute of Standards and Technology (NIST) under the National Voluntary Laboratory Accreditation Program (NVLAP) as an ISO 17025:2005 Laboratory (NVLAP Lab Code: 100227-0) and for this test procedure. The test reported in this document conformed explicitly with ASTM C423-17: "Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method." The specimen mounting was performed according to ASTM E795-16: "Standard Practices for Mounting Test Specimens During Sound Absorption Tests." A description of the measurement procedure and room specifications are available upon request.

### DESCRIPTION OF THE SPECIMEN

The test specimen was designated by the manufacturer as Carve baffles, spaced 12 in. on center. A full internal inspection performed on the test specimen by Riverbank personnel verified the manufacturer's description.

#### Specimen

Trade Name:	Carve
Material:	Polyethylene terephthalate felt
Overall Dimensions:	10 @ 2387.6 mm (94 in.) long x 28.96 mm (1.14 in.) wide x 241.3 mm (9.5 in.) high
Key Geometry:	9 mm (0.354 in.) thick felt body with 2.5 mm (0.098 in.) deep ridge patterns on both sides Concentration and orientation of ridge pattern varies between baffles Additional 54 mm (2.126 in.) wide x 9 mm (0.354 in.) thick felt pieces adhered to both sides of body at top edge
Overall Weight:	13.38 kg (29.5 lbs)

#### Physical Measures (per unit)

Dimensions:	0.24 m (9.5 in) wide by 2.39 m (94.0 in) long
Thickness:	0.03 m (1.14 in)
Weight:	1.34 kg (2.95 lbs)

## Test Report

**Turf Design**  
2018-12-06

**RAL-A18-433**  
Page 2 of 9

### Test Environment

Room Volume: 291.98 m<sup>3</sup>  
Temperature: 20.3 °C ± 0.0 °C  
Relative Humidity: 61.45 % ± 0.3 %  
Barometric Pressure: 99.8 kPa

Each sound absorbing unit had an average absorptive area (all exposed surfaces) of 2.00 m<sup>2</sup> (21.53 ft<sup>2</sup>).  
The total absorptive area (all exposed surfaces) of all sound-absorbing units was 20.00 m<sup>2</sup> (215.28 ft<sup>2</sup>).  
The array of units covered 6.66 m<sup>2</sup> (71.64 ft<sup>2</sup>) of chamber floor surface (total treated area).

### MOUNTING METHOD

Type J Mounting: The specimen is an array of ten (10) spaced sound absorbing baffles suspended from an array of cables such that the bottom face of the baffles is located approximately 1193.8 mm (47 in.) above the horizontal test surface. This approximates the mounting method of a typical ceiling baffle installation. The baffles were evenly distributed in a single row, spaced 304.8 mm (12 in.) on center.

### TEST RESULTS

Note: There is currently no standardized method for calculating Absorption Coefficients from spaced object absorbers. The sound absorption performance of spaced object absorbers should not be compared directly with specimens tested as a single rectangular area (e.g. mounting types A, E, etc.).

1/3 Octave Center Frequency (Hz)	Total Absorption		Absorption per Unit	
	(m <sup>2</sup> )	(Sabins)	(m <sup>2</sup> / Unit)	(Sabins / Unit)
100	0.64	6.91	0.06	0.69
** 125	0.23	2.45	0.02	0.24
160	0.95	10.21	0.09	1.02
200	1.15	12.38	0.12	1.24

### **Appendix C to ASTM C423 Sound Absorption Test**

Non-standard calculation of equivalent NRC Rating and Absorption Coefficients from spaced absorbers.

At this time ASTM C423 does not provide a standard method for determining absorption coefficients of spaced object absorbers. Tests of a set of sound absorbing objects spaced apart from each other will yield higher absorption rates than a specimen joined together as a single patch (A-Mount or E-Mount). For this reason it is unfair to provide NRC or absorption coefficient ratings for specimens that consist of a spaced set of absorbers. Despite this, the architectural industry has expressed great demand for a simple "single number" rating for these treatments. Likewise, acoustical consultants desire equivalent absorption coefficient data for use in acoustical modeling programs. The following is an attempt to appease these demands until ASTM develops a standard method for calculation. Several alternate non-standard calculation methods are provided. Riverbank Acoustical Laboratories prefers method 1.

#### **Method 1) Apparent Sound Absorption Coefficient calculated from total test surface area covered.**

The total sound absorption yielded by the specimen is divided by the total surface area of the test surface covered by the suspended baffles, including intermediate spaces. The baffle rigging covered  $6.66 \text{ m}^2$  ( $71.64 \text{ ft}^2$ ) of horizontal test surface area. With an additional 304.8 mm (12 in.) of width to account for the space between the tested array and what would be the next baffle in a larger array, the surface area comes to  $7.38 \text{ m}^2$  ( $79.48 \text{ ft}^2$ ). Apparent Noise Reduction Coefficient (NRC) rating and Sound Absorption Average (SAA) figures are calculated from this data based on the methods described in ASTM C423-17. This may be the most accurate method for comparing baffle arrays to ceiling tile products. In acoustical modeling applications, the apparent sound absorption coefficient data can be assigned to a single horizontal surface or plane for approximation of baffle array performance. Such approximations rely on the assumptions that baffle spacing is similar to the tested specimen and that the installation occurs over a perfectly reflective ceiling surface.

#### **Method 2) Apparent Sound Absorption Coefficient calculated from total exposed surface area of specimen.**

The total sound absorption yielded by the specimen is divided by the total surface area of all exposed specimen faces, as obtained from client CAD models ( $2.00 \text{ m}^2$  ( $21.53 \text{ ft}^2$ ) per baffle x 10 baffles =  $20.00 \text{ m}^2$  ( $215.28 \text{ ft}^2$ ) total surface area). Apparent Noise Reduction Coefficient (NRC) rating and Sound Absorption Average (SAA) figures are calculated from this data based on the methods described in ASTM C423-17. This method shows the actual absorption occurring at the exposed surfaces, but does not provide a fair comparison with materials mounted as a uniform patch (in A-mount or E-mount).

#### **Method 3) Apparent Sound Absorption Coefficient calculated from one face per baffle.**

The total sound absorption yielded by the specimen is divided by the surface area of one side of one large face for each baffle in the specimen ( $0.58 \text{ m}^2$  ( $6.20 \text{ ft}^2$ ) per baffle x 10 baffles =  $5.76 \text{ m}^2$  ( $62.01 \text{ ft}^2$ ) total surface area). Apparent Noise Reduction Coefficient (NRC) rating and Sound Absorption Average (SAA) figures are calculated from this data based on the methods described in ASTM C423-17. This method is favored by some material manufacturers since it yields very high NRC figures, but does not provide a fair comparison with other ceiling tile or wall panel products. Riverbank Acoustical Laboratories recommends that results obtained from this method be used for research and comparison purposes only; such results should not be used for marketed claims of product performance.
