Halliburton Reservoir Description Tool (RDT™) Formation Tester

OVERVIEW

When flexibility and versatility are required, the Halliburton Reservoir Description Tool (RDT™) tool collects—in a single deployment—formation pressure, fluid ID, and samples. Using the Focused Oval Pad and next-generation Integrated Characterization Section (ICS), combined with the Fluid Identification Section (FLID), the RDT tool captures the complete fluid composition and high-quality samples. It is easily customized to enable efficient formation pressures and complete fluid characterization. There is also no technology sacrifice to perform pressure and sampling at high pressures.

Complex conditions require unique solutions. The customizable service allows formation pressures and anisotropy data to be collected with standard Dual Probes. When sampling or downhole fluid identification is required, the RDT tool's Oval Pad is the industry's largest single-pad surface flow-area probe. For minimizing rig time, the Focused Oval Pad combines the extra-large surface flow area of the Oval Pad empowered by split-flow focusing. It delivers the lowest contamination samples possible with industry-leading efficiency.

The total performance of a system is limited by the weakest link, and collecting clean fluid samples requires best-in-class flushing pumps. The RDT Flow Control Pump Sections are proven to be the most versatile with a full range of differential pressures, the highest horsepower, and the fastest rates.The unique Dual-Probe Section offers increased efficiency through its ability to perform multiple tests with a single set of the tools. Dual Probes enable more reliable determination of formation pressure and mobility, as well as a more detailed understanding of heterogeneity and anisotropy.

BENEFITS

- Reduces rig time
  - Lowers risk of stuck tool
  - Increases operational efficiency
- Reduces risk of sanding/mitigates effects
  - Greater success in sample recovery
- Increases fluid sample purity
  - Reduces uncertainty in establishing connectivity
  - Increases confidence of flow assurance

Oval Pad

RESERVOIR DESCRIPTON TOOL (RDT™) FORMATION TESTER

Dual-Probe Section

DUAL-PROBE SECTION

The unique Dual-Probe Section (DPS) offers increased efficiency through its ability to perform multiple tests with a single set of the tools. Dual Probes enable more reliable determination of formation pressure and mobility, as well as a more detailed understanding of heterogeneity and anisotropy.

DPS PROBE SELECTION

Complex conditions require unique solutions. Our customizable service allows formation pressures and anisotropy data to be collected with our standard Dual Probes. When sampling or downhole fluid identification is required, we offer the Oval Pad, the industry's largest single-pad surface flow-area probe. For minimizing rig time, nothing but the best is required. The Focused Oval Pad combines the extra-large surface flow area of the Oval Pad empowered by split-flow focusing. It delivers the lowest contamination samples possible with industry-leading efficiency.

FOCUSED OVAL PAD

Cleaner, faster samples, even in low permeability

Combining the extra-large surface flow area of the Oval Pad and empowered by split-flow focusing, the Focused Oval Pad delivers the lowest contamination samples possible with industry-leading efficiency. With increased focus on high-quality samples in less rig time, the RDT Focused Probe delivers ultraclean samples with the fastest pump rates and largest focused probe area.

DPS OVAL PAD

Running circles around the competition

Our proven RDT Oval Pad has the advantage in all environments due to its larger flow area and vertical straddle of the formation.

RESERVOIR DESCRIPTON TOOL (RDT™) FORMATION TESTER

Dual-Port Straddle Section

DUAL-PORT STRADDLE SECTION

A paradigm shift has occurred in medium to low-permeability environments using the Reservoir Description Tool (RDT™) formation tester combined with the Dual-Port Straddle Packer (SPS). In the past, dual packers were not considered the first choice for sampling in medium to low-permeability formations as the sample quality obtained was poor.

The RDT Dual-Port Straddle Section uses controllable screen ports positioned at the top and the bottom of the annular interval. This spacing allows for the interval to be drained to take full advantage of segregation in the annular volume and obtain clean samples. Producing true radial flow, the Dual-Port SPS is also the best choice for mini DST and microfrac operations.

SEAMLESSLY COMBINED WITH RDT TOOL

When flexibility and versatility is required, the RDT tool will collect in a single deployment formation pressure, fluid ID, and samples. The Dual-Port SPS is one of the many options that can be combined as part of the RDT tool string and the combination of probes. It can be designed to cover all your pressure and sampling needs in a single run.

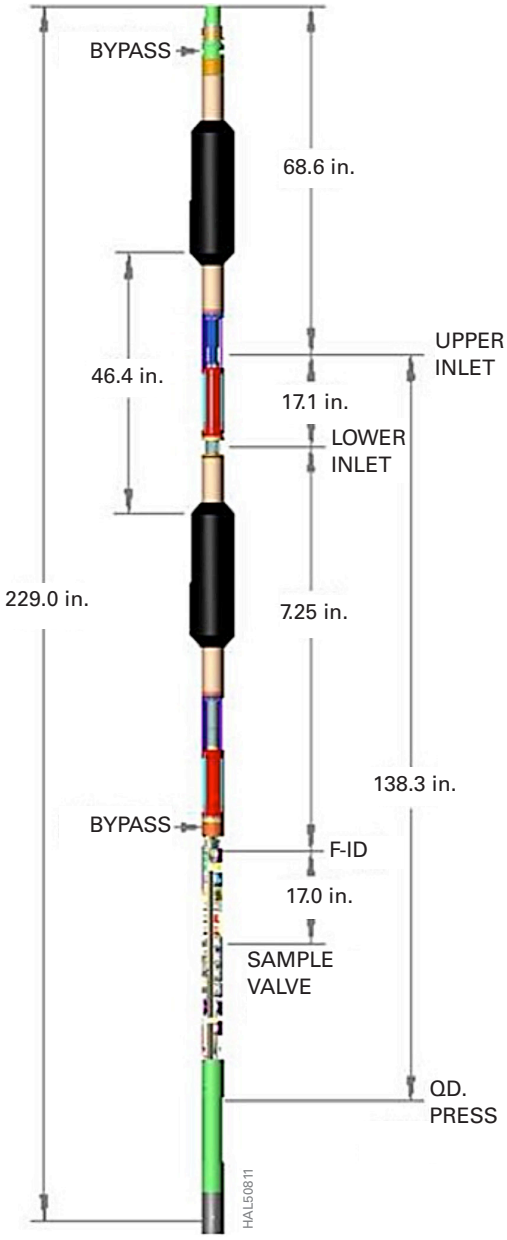
LARGE FLOW AREA

The advantage of the Dual-Port SPS is the increased flow area which enables faster flow rates and the ability to sample in very low-permeability environments. Dual-Port SPS should be used to flow a low-permeability formation while minimizing the drop in formation pressure during sampling. With a standard 1-m and 3-m spacing with dual-port capability, the RDT straddle packer can straddle a desired interval and lower perm environments or fractured or laminated zones.

DUAL PORT SAMPLING

Dual-port sampling opens up a new opportunity for sampling with straddle packers. The control of the flow from the upper and lower annular interval enables the mud and contamination to be drained to the bottom of the interval and the upper port to sample the segregated fluid. In the case of immiscible fluids, such as oil or gas sampling in water-based mud where the heavier phase is the contamination, the ability to sample high-quality hydrocarbon samples is possible in a very short period of time. In many cases, sampling using the Dual-Port SPS is faster than any other method for premium quality samples.

In a miscible system, such as oil, in oil-based mud, the Dual-Port SPS advantage improves the sample quality in low-permeability environments as it separates the mud in the sump from the desired fluid and improves contamination significantly.



FOCUSED FLOW INTERVALS

Upper and lower sections of the borehole may be flowed sequentially or at the same time by full surface control of the port. Dual pump with industry-leading pump rates can flow from both the upper and lower interval on an isolated flow patch to generate a focused flow interval.

FLOW CONTROL PUMP SECTIONS (FPS)

The total performance of a system is limited by the weakest link and collecting of clean fluid samples requires the best-in-class pump modules. The RDT flushing pumps are proven to be the most versatile with a full range of differential pressures and the highest horsepower and the fastest rates.

MINI DST AND MICROFRAC

The RDT Dual-Port SPS can perform using true radial flow-extended buildup for mini DST and microfrac operations. The Dual-Port SPS has a wide range of applications for more extensive test programs and opens up new design possibilities.

RESERVOIR DESCRIPTON TOOL (RDT™) FORMATION TESTER

Dual-Port Straddle Packer–High Strength

DUAL-PORT STRADDLE SECTION

A paradigm shift has occurred in medium to low-permeability environments using the Reservoir Description Tool (RDT™) formation tester combined with the Dual-Port Straddle Packer (SPS). In the past, dual packers were not considered the first choice for sampling in medium to low-permeability formations as the sample quality obtained was poor.

The RDT Dual-Port Straddle Section uses controllable screen ports positioned at the top and the bottom of the annular interval. This spacing allows for the interval to be drained to take full advantage of segregation in the annular volume and obtain clean samples. Producing true radial flow, the Dual-Port SPS is also the best choice for mini DST and microfrac operations.

SEAMLESSLY COMBINED WITH RDT TOOL

When flexibility and versatility is required, the RDT tool will collect in a single deployment formation pressure, fluid ID, and samples. The Dual-Port SPS is one of the many options that can be combined as part of the RDT tool string and the combination of probes. It can be designed to cover all your pressure and sampling needs in a single run.

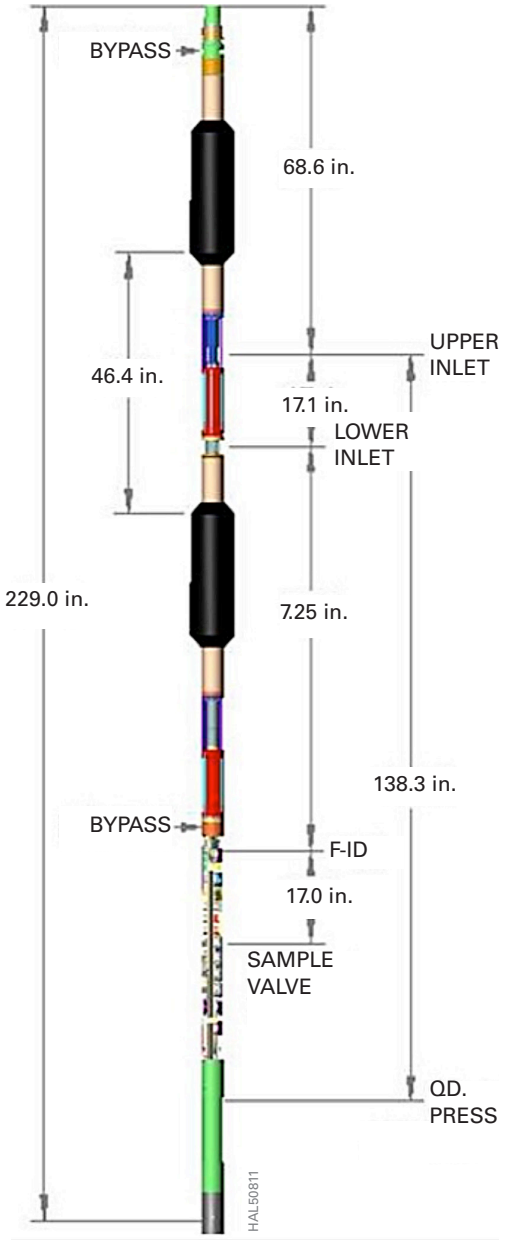
LARGE FLOW AREA

The advantage of the Dual-Port SPS is the increased flow area which enables faster flow rates and the ability to sample in very low-permeability environments. Dual-Port SPS should be used to flow a low-permeability formation while minimizing the drop in formation pressure during sampling. With a standard 1-m and 3-m spacing with dual-port capability, the RDT straddle packer can straddle a desired interval and lower perm environments or fractured or laminated zones.

DUAL-PORT SAMPLING

Dual-port sampling opens up a new opportunity for sampling with straddle packers. The control of the flow from the upper and lower annular interval enables the mud and contamination to be drained to the bottom of the interval and the upper port to sample the segregated fluid. In the case of immiscible fluids, such as oil or gas sampling in water-based mud where the heavier phase is the contamination, the ability to sample high-quality hydrocarbon samples is possible in a very short period of time. In many cases, sampling using the Dual-Port SPS is faster than any other method for premium quality samples.

In a miscible system, such as oil, in oil-based mud, the Dual-Port SPS advantage improves the sample quality in low-permeability environments as it separates the mud in the sump from the desired fluid and improves contamination significantly.



FOCUSED FLOW INTERVALS

Upper and lower sections of the borehole may be flowed sequentially or at the same time by full surface control of the port. Dual pump with industry-leading pump rates can flow from both the upper and lower interval on an isolated flow patch to generate a focused flow interval.

FLOW CONTROL PUMP SECTIONS (FPS)

The total performance of a system is limited by the weakest link and collecting of clean fluid samples requires the best-in-class pump modules. The RDT flushing pumps are proven to be the most versatile with a full range of differential pressures and the highest horsepower and the fastest rates.

RESERVOIR DESCRIPTON TOOL (RDT™) FORMATION TESTER

Fluid-Identification Section

Fluid density is the cornerstone of fluid identification and fluid contacts downhole, and a critical measurement for formation testing. The Reservoir Description Tool (RDT™) Fluid-Identification Section (FLID) combines a best-in-class high-resolution density sensor with co-located complementing sensors to accurately measure miscible and immiscible formation fluids.

HIGH-RESOLUTION FLUID DENSITY

The unique vibrating tube densometer enables high-resolution fluid density measures accurate fluid density and the change in density from filtrate to native fluid.

CONTAMINATION

Density contrast from filtrate to native fluid will indicate the level of contamination and determine when the desired sample purity is reached using Fluid Studio. The high-resolution of the FLID densomenter ensures all changes in fluid density are measured and contamination determined.

MAKING SENSE OF IMMISCIBLE FLUIDS

Using the combination of volume vs. high-resolution sensors allows the FLID to produce a volumetric map of the fluids. This map enable you to see the volumes of all flowing fluids and make real-time sampling decisions. Immiscible maps are a valuable tool in understanding complex fluids that in the past were treated as poor-quality data.

CO-LOCATED SENSORS

Utilizing multiple sensors of density, capacitance, and resistivity to perform fluid identification allows multiple sensor confirmation of fluids. This is very valuable in the case of free gas or water, which can interfere with the fluid analysis.

RESERVOIR DESCRIPTON TOOL (RDT™) FORMATION TESTER

Integrated Characterization Section A

NEW GENERATION OF DOWNHOLE FLUID COMPOSITION

The Reservoir Description Tool (RDT™) Integrated Characterization Section (ICS) expands measurements of fluid composition downhole by using ICE Core® technology. Based on our unique multivariate optical computing technique, this enables high-resolution hydrocarbon compositional analysis.

MEASUREMENT OF SATURATES, RESINS, AROMATICS, AND ASPHALTENES (SARA)

With superior signal-to-noise ratio compared to conventional downhole techniques, our ICE Core technology uses direct optical computing of the full wavelength to create a unique fingerprint of the fluid, including differentiation of the C6+ SARA fractions.

GAS COMPOSITION

ICE Core technology in ICS-A measures single-phase gas component – C1.
We also measure total gas GOR directly, not as an estimate from C1, making the measurement more accurate.

DISPLAY WEIGHT PERCENTAGE

The ICS measures an absolute density of each measured component. It can be displayed in weight percentages, making the final results directly comparable to lab measurements with an easy-to-use composition display.

SAMPLE PURITY DETERMINATION

The ICS with multiple ICE Core samples uses gas and the liquid-phase composition to determine contamination. As methane gas isn't present in oil-based mud, the gas volume and GOR can be used. When combined with the saturates and aromatics composition, the change in liquid-phase content can also be determined as the SARA fingerprint of filtrate and native fluid differs.

Dry Gas	<0.375 g/cc	N/A	> 50,000

NOTE:
- Excludes subcategories of Extra Heavy, Medium Heavy, and Medium Light.
- Ranges assume reservoir fluids from 3,000 to 15,000 psi and 150°F to 300°F.

Physical Strengths

Hardware	Tool Joints RDT
Tension	200,000 lb (90,719 kg)*
Compression	200,000 lb (90,719 kg)*
Torque	600 ft-lb (813 N-m)*

* Strengths apply to new tools at 70°F (21°C) and 0 psi.

RESERVOIR DESCRIPTON TOOL (RDT™) FORMATION TESTER

Integrated Characterization Section B

NEW GENERATION OF DOWNHOLE FLUID COMPOSITION

The Reservoir Description Tool (RDT™) Integrated Characterization Section (ICS) expands measurements of fluid composition downhole by using ICE Core® technology. Based on our unique multivariate optical computing technique, this enables high-resolution hydrocarbon compositional analysis.

MEASUREMENT OF SATURATES, RESINS, AROMATICS, AND ASPHALTENES (SARA)

With superior signal-to-noise ratio compared to conventional downhole techniques, our ICE Core technology uses direct optical computing of the full wavelength to create a unique fingerprint of the fluid, including differentiation of the C6+ SARA fractions.

GAS COMPOSITION

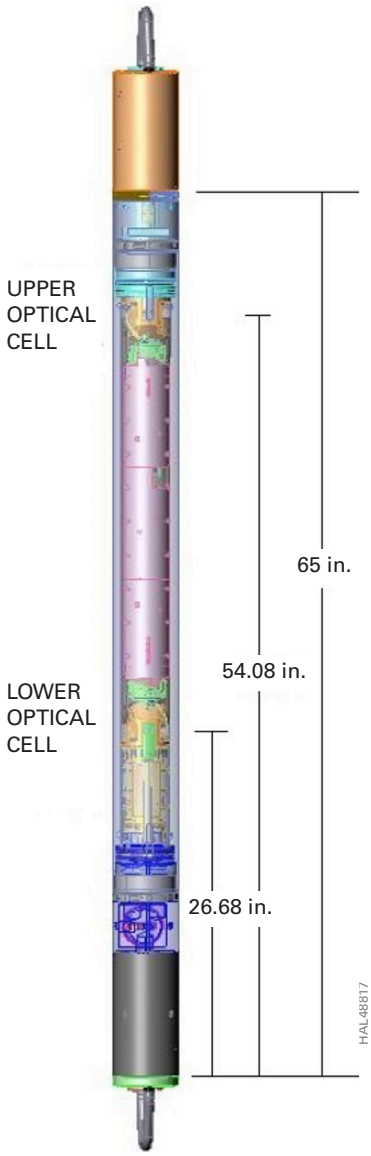
ICE Core technology measures single-phase gas components – C1, C2, C3, and CO_2 gas. We also measure total gas GOR directly, not as an estimate from C1, making the measurement more accurate.

DISPLAY WEIGHT PERCENTAGE

The ICS measures an absolute density of each measured component. It can be displayed in weight percentages, making the final results directly comparable to lab measurements with an easy-to-use composition display.

SAMPLE PURITY DETERMINATION

The ICS with multiple ICE Core samples uses gas and the liquid-phase composition to determine contamination. As methane gas isn't present in oil-based mud, the gas volume and GOR can be used. When combined with the saturates and aromatics composition, the change in liquid-phase content can also be determined as the SARA fingerprint of filtrate and native fluid differs.



Dimensions and Ratings

Max Temperature	350˚F (177˚C)
Max Pressure	25,000 psi (172 MPa)
OD	4.75 in. (12.065 cm)
Length	5.40 ft (1.646 m)
Weight	261 lb (118.38 kg)

Borehole Conditions

Borehole Fluids	Salt ■	Fresh ■	Oil ■	Air ■
Recommended Logging Speed	Stationary			
Tool Positioning	Centralized ■	Eccentralized ■		

Optical Sensing Unit

Quantity	One
Number of Channels	20
Detectors	Single Thermopile
Optical Window	Sapphire

Measurements

Strain Gauge Pressure Transducers	
Accuracy	Resolution
+/- 0.1% full scale	0.2 psi (1.4 KPa)
Fluid Temperature	
Accuracy	Resolution
3% full scale	0.02°F (-18°C)

ICS-B - Compositional Specifications Optical Sensor Version 2

Sensor	Range	Accuracy	Fluid Type			
			Volatile Oil	Light Oil	Medium Oil	Gas/ Condensate
GOR	0 to 2000 GOR units	Greater of 200 scf/bbl or 20% of Range		✓	✓	
GOR	2000 to 4000 GOR units	Greater of 500 scf/bbl or 25% of Range	✓			
Methane	0.02 to 0.3 g/cc	10% Partial Density	✓	✓	✓	✓
Ethane	0.02 to 0.12 g/cc	15% Partial Density		✓	✓	✓
Propane	0.015 to 0.07 g/cc	20% Partial Density		✓	✓	✓
CO_2 (gas phase)	0.015 to 0.07 g/cc	20% Partial Density				✓
Saturates	0.3 to 0.7 g/cc	10% Partial Density		✓	✓	
Aromatics	0.05 to 0.3 g/cc	20% Partial Density		✓	✓

RESERVOIR DESCRIPTON TOOL (RDT™) FORMATION TESTER

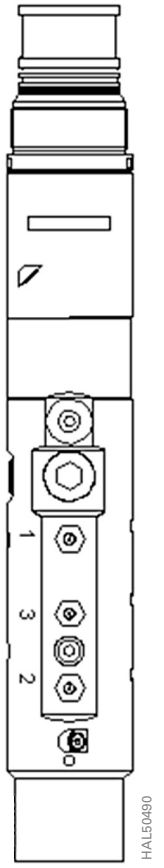
Bulk Chamber Section

The RDT Bulk Sampling Section (CVS) is available in dual and single sample configuration to obtain zero shock or dump samples starting at 1 gal (3.8 L). The dual sample option enables two separate bulk samples to be taken using controlled sample valves. The dual sample configuration can use either dual 2.75 gal (10.4 L) chambers or dual 1.0 gal (3.8 L) chambers.

The single sample option enables a single bulk sample to be obtained with zero shock using either 2.75 gal (3.8 L) or 1.0 gal (3.8 L) chambers. The single sample chamber volume can expanded by stacking multiple chambers to the desired volume.



Dimensions and Ratings

Max Temperature	350°F (177°C)
Max Pressure	20,000 psi (138 MPa)
OD	4.75 in. (12.07 cm)
Length	2.3 ft (70 m)
Weight	75 lb (34 kg)
