## Hostile WaveSonic<sup>®</sup> Service

Halliburton's Third-Generation, Ultra-Reliable, Crossed-Dipole Sonic Tool

Halliburton's Hostile WaveSonic\* crossed-dipole sonic tool makes it easy to determine fast and slow shear wave travel times and their orientation in the formation. With the WaveSonic service, you can even calculate minimum and maximum principal stresses and stress field orientation by combining oriented slowness data with overburden and pore-pressure data. This information is vital for geomechanical analysis, wellbore stability, and production enhancement treatment design.

Sonic anisotropy and the orientation of the anisotropy can be used to determine the orientation of natural fractures. Sonic attributes such as P-wave slowness, fast and slow shear wave travel time, identification of compressive fluids in the pore space, and anisotropy orientation allow for better 3D seismic analysis.

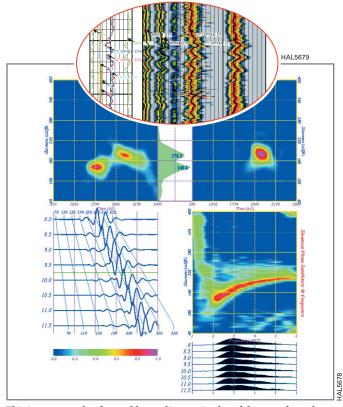

## The Product of Superior Technology

The Hostile WaveSonic service provides simultaneous monopole and crossed-dipole sonic information. P-wave and S-wave slowness can be obtained in formation conditions ranging from poorly consolidated high-porosity gas-saturated sandstones to low-porosity carbonates. The flexural wave energy is propagated from a low-frequency, on-depth, crossed-dipole bender-bar source. The low-frequency flexural wave travels at the true shear slowness of the formation. A low-frequency monopole source is used, so the P-wave and flexural wave data have similar depths of investigations well beyond any near-wellbore alteration.

## **Benefits**

- Low-frequency monopole and dipole sources for deeper investigations of sonic slowness measurements beyond any near-wellbore alteration effects
- Broadband eight-level, quad-receiver array for high-quality waveform data; all 96 waveforms for each set of transmitter firings are recorded at the surface for advanced waveform-processing techniques
- Combinable with the HEAT<sup>™</sup> Suite tools

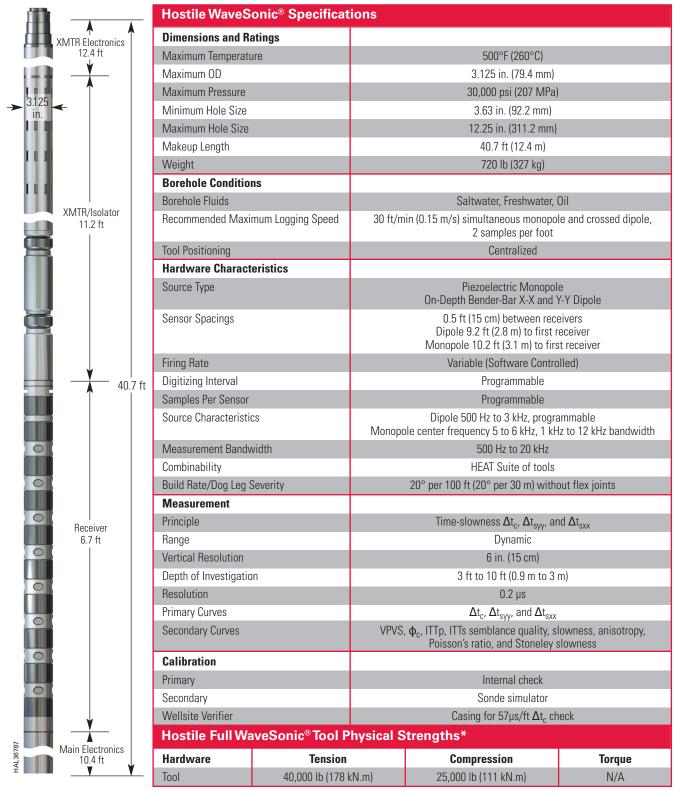

- On-depth, low-frequency bender-bar source provides a clean source signal
  - No need for dispersion corrections for slowness determination
  - No depth shifting of waveform data for anisotropy analysis
- Robust tool isolator design allows for drillpipe-conveyed operations; WaveSonic tool not limited to bottom of tool string

This is an example of a semblance diagnostic plot of the waveform data from the eight waveforms. In the circle is a section of a log showing monopole P-wave slowness and semblance quality, monopole refracted shear-wave slowness and semblance quality, X-X dipole slowness and semblance quality, and Y-Y dipole slowness and semblance quality.

## FORMATION EVALUATION

\* Strengths apply to new tools at 70°F (21°C) and 0 psi (0 MPa)
