

ExpressFiber™ Disposable Fiber Cable

LOW-COST FIBER FOR ROUTINE CROSS-WELL MONITORING

OVERVIEW

Today, fiber optic fracture monitoring provides valuable insights that help operators understand and validate fracture performance. However, for many operators, the historical cost and complexity of incorporating fiber at scale is simply not economically feasible. To provide low cost fiber solutions that operators can use routinely in every well, Halliburton has engineered out cost and complexity of fiber optic fracture monitoring.

ExpressFiber™ disposable fiber cable is the newest addition to our scalable fiber portfolio that provides a direct measurement of well interference—at a price point comparable to tracers and indirect pressure analysis.

ExpressFiber is run in offset wells to acquire direct measurements of distributed acoustic sensing (DAS) microseismic, strain and temperature. In addition to being able to install this fiber on existing wells in a few hours, this disposable, low cost fiber makes cross-well monitoring a routine service you can benefit from in every well on your pad, across your entire asset.

When all you want is to better understand frac hits, fracture growth and interactions, ExpressFiber is the economic, risk-free fiber optic option for cross-well monitoring.

A DIRECT MEASUREMENT
OF WELL INTERFERENCE,
AT A PRICE POINT
COMPARABLE TO INDIRECT
PRESSURE OR TRACER
MEASUREMENTS.

INSTALLED ON EXISTING
WELLS IN A FEW HOURS.

LOW-COST, LOW-RISK
FIBER
FOR ROUTINE
CROSS-WELL MONITORING

LOW RISK FIBER

Because its disposable, this single use fiber eliminates any concerns of damaging the cable during fracturing. ExpressFiber can be pumped down hole at any point in time before or during the fracturing operation.

This means you now have the opportunity to monitor cross-well interactions on already drilled wells. If at any time the cable is damaged, another fiber can simply be pumped down to replace it. There is no need to halt operations to remove the fiber, as the amount of space it takes up is equivalent to a pound of proppant.

The disposable technology allows the fiber to withstand downhole conditions for the duration of the stimulation treatment before degrading and exiting through perforations.

QUALITY MEASUREMENTS

Just because it's disposable, doesn't mean its low quality. Disposable fiber is bare fiber, meaning there is no outer protective layer, making it more sensitive. ExpressFiber acquires high quality strain, microseismic and temperature data, only at a significantly lower price.

ExpressFiber is run downhole to enable our SmartFleet™ intelligent fracturing system and subsurface monitoring services, such as our CrossWatch™ cross well monitoring service. The CrossWatch service provides insights that help you understand fracture growth to prevent communication and improve capital efficiency.

CrossWatch allows you to pinpoint cross well interference by using strain and DAS microseismic measurements. Analytics include treatment volumes, growth over time, and azimuth for a detailed picture of how and when connection of offset wells are established. With a single sensor detecting multiple measurements, you now have the ability to understand how fracture uniformity is impacting offset wells. CrossWatch also confirms communication across different benches, allowing you to monitor the frequency and severity of communication across multiple intervals.

ZERO IMPACT TO OPERATIONS

With ExpressFiber, you can start recording cross-well data in a few hours, from the time of pump-down to pressing record.

All the equipment you need to install is already on site, and it's as simple as dropping the fiber down hole and pumping it out to the toe. Once the fiber is in the wellbore, it's hooked up to the interrogator unit and recording begins.

Trying to understand what's happening downhole while fracturing is complicated. The solution shouldn't be. When all you want is to better understand frac hits, ExpressFiber is for you.

Learn more about this low-cost option for direct cross-well measurements by contacting us today, or visit us on the web at www.halliburton.com

HIGHLIGHTS:

CROSS-WELL DATA FOR EVERY PAD

- » High quality DAS strain, microseismic and temperature data

LESS RISK

- » Low-cost, simple to deploy fiber
- » No additional equipment required
- » Zero impact to operations

Sales of Halliburton products and services will be in accord solely with the terms and conditions contained in the contract between Halliburton and the customer that is applicable to the sale. ExpressFiber is enabled by FiberLine Intervention (FLI), a wellbore surveying technique from Well-SENSE Technology Limited.
