

Put your origination data to work.

One open data platform, ready for anything, from analytics and automated reports to your next AI initiative.

Build your future on your origination data. Origence Data Access turns your data into an open platform for analytics, reports, APIs, and live data-sharing. Use them independently or all together as part of a modern data strategy. Built on the tools you already run, with no proprietary lock-in, Origence Data Access elevates teams from preparing data to acting on it.

Lakehouse sharing

Live data available in your own Microsoft Fabric or Snowflake environment, governed at the source, with no exports, no pipelines, and no copies.

Scheduled reports

Build a report once and let it run itself, automated to deliver on your schedule. Eliminates manual effort and weekly report-building for your team members.

Interactive reports

Visualize and monitor origination performance inside arc OS™, live from production data, ready to use without setup or a dedicated data team.

Lakehouse sharing for partners

Give trusted partners live access to your data, governed on your terms, with no custom integration and nothing copied out of your control.

Open APIs

Keep your systems and partners in sync the instant a loan funds, a document moves, or a decision returns, with governed, real-time APIs built for lending.

Data and image extract

Keep your established file-based workflows running without re-platforming, with scheduled data and image delivery and a clear path to self-service when you're ready.
