

Suture PassOR™

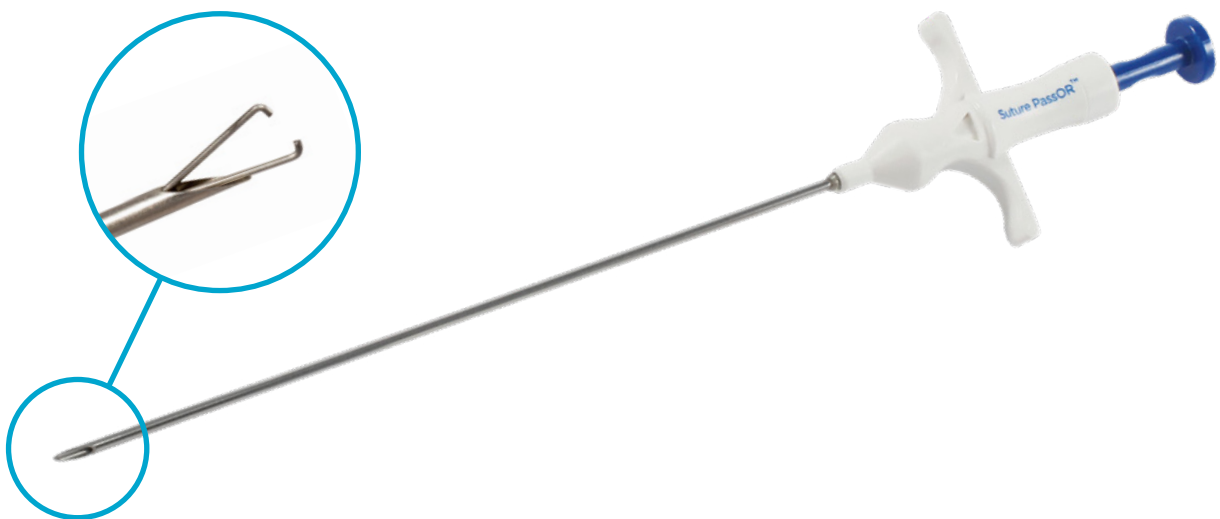

Ensure consistent and effective minimally invasive surgical suture placement.

Versatile and reproducible suture placement system.

The Suture PassOR™ is an intuitive surgical tool that ensures consistent, effective placement of sutures during a range of laparoscopic procedures. It also facilitates closure of both small and large port sites and is helpful when securing prosthetic materials during laparoscopic hernia procedures.

Designed to easily pass sutures through subcutaneous tissue, including fascia and peritoneum, the Suture PassOR™ enables reproducible, uniform closure across varying patient anatomy. This minimizes complications and costs associated with post-operative post-site hernia.
